1.0 Introduction

Driven by the widespread existence of social media platforms in the lives of students, the use of social media during online lectures has sparked concerns about its impact on students' engagement, focus, and academic performance. The goal of this study is to fully explore how social media use affects important factors like engagement in online lectures and investigate the complex relationship between digital involvement and academic achievements in virtual learning environments. It is theorized that higher social media usage during virtual lectures could result in lower levels of engagement and attendance. Furthermore, it is expected that heightened social media use may also hinder students' understanding and retention of course material, resulting in poor academic performance. By diving into these predicted linkages, this study hopes to provide useful insights into the relationship between social media involvement and students' academic achievement in online educational contexts.

This paper will begin by discussing the process of data collection and providing a detailed description of the parameters or variables to be measured. This will include outlining how we gather information on students' social media usage during online lectures and their corresponding academic performance metrics.

Following this, we will delve into the data analysis phase, where we'll categorize the collected data into two main types: categorical data and quantitative data. We'll explore how these different types of data provide insights into the relationship between social media use and academic performance.

Finally, based on our data analysis, we will draw conclusions regarding the impact of social media usage during online lectures on students' attendance, participation, and comprehension of course material. These conclusions will offer valuable insights into the potential implications for educators and stakeholders in optimizing online learning environments.

2.0 Data Collection

The methodology that we used in this project to collect data is through conducting a survey via Google Form. The survey consists of some parts, which are personal information of respondents, the usage of social media during online lectures and their opinion on the impact of social media use on their academic performance. Some of the questions in Google Form will be shown at the appendix part.

No	Question	Level of Measurement	Data Type
1	Gender	Nominal	Qualitative
2	Age	Ratio	Quantitative - Discrete
3	Ethnicity	Nominal	Qualitative
4	Faculty	Nominal	Qualitative
5	Year of Study	Interval	Quantitative - Discrete
6	Online lecturers attend per week	Ratio	Quantitative - Discrete
7	Number of social media apps in phone	Ratio	Quantitative - Discrete
8	Average time spend on social media each day	Interval	Quantitative - Continuous
9	Post or stories uploaded per week	Ratio	Quantitative - Discrete
10	Is social media important for you?	Nominal	Qualitative
11	Minutes spent on social media during a single online lecture session?	Interval	Quantitative - Discrete
12	Social media platform primarily use during online lectures	Nominal	Qualitative
13	Degree of distracting of social media during online lecturers	Ordinal	Qualitative
14	Average amount of time in checking social media	Ratio	Quantitative - Continuous

	notifications during online lectures		
15	Have you ever missed important information or content during an online lecture due to engaging with social media?	Nominal	Qualitative
16	Hours of uninterrupted study time on a typical day	Interval	Quantitative - Continuous
17	Overall academic performance this/last semester	Ordinal	Qualitative
18	Degree of impact of social media use during online lectures on academic performance	Ordinal	Qualitative

3.0 Data Analysis

3.1 Respondent Biography

3.1.1 Respondents' Gender

Gender	Frequency	Percentage
Male	22	35.5%
Female	40	64.5%
Total	62	100%

Table 3.1.1.1 Frequency and Percentage of Gender of Respondent

Figure 3.1.2.1 Pie Chart of Gender of Respondent

As indicated in Table 3.1.1.1 and Figure 3.1.1.1, which are the frequency table and pie chart of respondent gender, the frequency of male is 35.5 and female is 64.5. As a result, males have a relative frequency of 0.35 and females have a relative frequency of 0.65. In addition, the pie chart of responder gender illustrates that red means male and blue means female, enabling viewers to discern gender proportions effortlessly. This can also enhance the effectiveness of data communication.

3.1.2 Respondents' Age

Age	Frequency
19	4
20	32
21	11
22	8
23	4
24	3
Total	62

Table 3.1.2.1 Frequency Distribution of Age of Respondent

Figure 3.1.2.1 Bar Chart of Age of Respondent

The measure of Central Tendency	Value
Mean	20.7581
Median	20
Mode	20

Table 3.1.2.2 Measure of Central Tendency of Age of Respondents

As shown in Table 3.1.2.1 and Figure 3.1.2.1, the age distribution of respondents to our questionnaire is between 19 and 24 as this study focuses on undergraduates at UTM. There are four replies who are 19 years old, eleven who are 21 years old, eight who are 22 years old, four who are 23 years old, and three who are 24 years old. Furthermore, Table 3.1.2.2 shows that the data we acquired will primarily come from respondents aged 20, as our median and mode are both 20, and our mean is 20.7581. With this, we will have a deeper understanding of the demographic composition and age dynamics within the surveyed sample.

3.1.3 Respondents' Ethnicity

Ethnicity	Frequency
Malay	11
Chinese	45
Indian	6
Total	62

Table 3.1.3.1 Frequency Distribution of Ethnicity of Respondent

Figure 3.1.3.1 Pie Chart of Ethnicity of Respondent

As seen in Table 3.1.3.1 and Figure 3.1.3.1, the distribution of respondent ethnicity reveals a diverse landscape. Among the respondents, Malay ethnicity stands at 11 individuals, indicating a presence within this sample. However, the majority of respondents identify as Chinese, with 45 individuals representing this ethnic group. Meanwhile, Indian ethnicity is represented by 6 respondents.

3.1.4 Respondents' Faculty

Faculty	Frequency
Civil Engineering	3
Chemical & Energy Engineering	2
Electrical Engineering	5
Built Environment & Surveying	4
Computer	31
Science	7
Social Science & Humanities	3
Management	6
Malaysia-Japan International of Technology	1
Total	62

Table 3.1.4.1 Frequency Distribution of Faculty of Respondent

Figure 3.1.4.1 Bar Chart of Faculty of Respondent

Among the faculties surveyed, Computer Science emerges as the most prominent, with a substantial representation of 31 respondents. Following closely, Electrical Engineering and Built Environment & Surveying demonstrate significant frequencies, with 5 and 4 respondents respectively. Moreover, Management and Science faculties are also well-represented, each accounting for 6 and 7 respondents respectively. While other faculties such as Civil Engineering, Chemical & Energy Engineering, Social Science & Humanities, and Malaysia-Japan International of Technology exhibit smaller frequencies.

3.1.5 Respondents' Year of Study

Year of Study	Frequency
2020/2021	4
2021/2022	6
2022/2023	4
2023/2024	48

Table 3.1.5.1 Frequency Distribution of Year of Study of Respondent

Figure 3.1.5.1 Bar Chart of Year of Study of Respondent

As indicated in Table 3.1.5.1 and Figure 3.1.5.1, 4 respondents represent the academic year 2020/2021 in University Technology Malaysia. Moving forward, the ensuing academic year, 2021/2022, sees a minor increase of 6 responses. However, in the school year

2022/2023, the frequency drops to 4 responses. The most significant presence is noticed in the academic year 2023/2024, with a startling 48 respondents reported.

3.1.6 Respondents' Average Online Lecturer Attendance

Quartile	Frequency
0.25	4.0
0.50	7.0
0.75	10.0

Table 3.1.6.1 Measure of Quartile for Boxplot of Average Attendance per Week

Figure 3.1.6.1 Box Plot of Average Attendance per Week

In Figure 3.1.6.1, we can see that our box is probably at the middle of the graph, indicating that more students have online classes between 5 to 10 per week. In table 3.1.6.1, our first quartile lies at 4.0, the second quartile lies at 7.0 and the third quartile lies at 10.0. There also exists one outlier with a frequency of 20, that has classes very frequent. He/she are possibly influenced by factors such as social media-driven discussions, supplementary online tutorials, or other forms of digital learning resources.

3.2 Respondents' Usage of Social Media Applications

3.2.1 Respondents' Social Media Apps in Phone

Number of Social Media Apps	Frequency
2	1
3	8
4	10
5	13
6	13
7	3
8	4
9	1
10	5
12	3
15	1

Table 3.2.1.1 Frequency Distribution of Number of Social Media Apps in Phone

3.2.2 Respondents' Time of day for Accessing Social Media per Day

Range (hours)	Frequency	Percentage
0-2	12	19.35%
3-5	31	50%
6-8	15	24.19%
9-11	3	4.84%
12-14	1	1.62%
Total	62	100%

Table 3.2.2.1 Frequency Distribution of Time for Accessing Social Media

Figure 3.2.2.1 Scatter Plot for Total Number of Social Media vs Duration Spend on It

This figure is a graphical representation used to display the relationship between the number of social media apps installed on a phone and the frequency of accessing social media per day. Firstly, there appears a positive correlation between the two variables, indicating that individuals who spend more time on social media tend to have a greater number of social apps installed on their phones. Additionally, a significant portion of respondents spend between 3-5 hours on social media per day, with a sizable number also spending 0-2 and 6-8 hours. However, there is an outlier with a high number of apps but relatively low time spent on social media.

As individuals spend significant amounts of time on social media platforms, universities can leverage these channels to enhance education delivery and engagement. By integrating educational content into social media platforms, universities can meet students where they are, making learning more accessible and engaging. Strategies such as live Q&A sessions with professors, short educational videos, discussion forums, and announcements can be disseminated through social media channels to foster interaction and collaboration among students and faculty.

3.2.3 Respondents' Average Number of Posts and Stories Uploaded per Week

Quartile	Frequency
0.25	1.0
0.50	3.0
0.75	7.0

Table 3.2.3.1 Measure of Quartile for Box Plot of Average Number of Post / Stories per Week

Figure 3.2.3.1 Box Plot for Number of Post / Stories per Week

As indicated in Figure 3.2.3.1, we can see that our box is slightly skewed to the bottom, indicating that more students only post stories between 0-7 per week. In Table 3.2.3.1, our first quartile lies on 1.0, second quartile lies on 3.0 and third quartile lies on 7.0. There also exist two outliers, with the frequency of 20 and 25, that post a post or stories very frequently. This data tells us that the majority posting moderately while a few individuals demonstrate higher levels of engagement. This greater commitment may influence how they interact with online lectures, such as sharing lecture details, seeking clarification, or discussing course concepts with peers.

3.2.4 Importance of Social Media

Is social media important	Frequency
Yes	37
No	5
Maybe	20

Table 3.2.4.1 Frequency Distribution of Importance of Social Media for Respondents

Is Social Media Important?

Figure 3.2.4.1 Pie Chart of Importance of Social Media for Respondents

The figure 3.2.4.1 illustrates the distribution of responses regarding the importance of social media. Most respondents which is 59.7% of the respondents responded “Yes” indicating that they thought social media was important. Meanwhile, 8.1% of respondents responded they disagreed, suggesting they didn’t think social media was that significant. However, 32.3% of respondents responded “Maybe” indicating that they were undecided or conflicted about the significance of social media.

3.2.5 Average Time (minutes) Spent on Social Media During Online Lectures

Average time (min)	Frequency	Relative frequency	Cumulative frequency
0-24	43	0.69	0.69
25-49	15	0.24	0.93
50-74	2	0.03	0.96
75-99	1	0.02	0.98
100-124	1	0.02	1.00
Total	62	1.00	1.00

Table 3.2.5.1 Frequency Distribution of Average Time of Respondents' Average Time Spent on Social Media During Online Lectures

Figure 3.2.5.1 Bar Chart of Average Time of Respondents' Average Time Spent on Social Media During Online Lectures

The bar chart depicts the distribution of average time spent in minutes by respondents segmented into five intervals. Each bar represents a specific time range which is from 0-24 minutes to 100-124 minutes. The figure shows that the largest bar accounting for 69% of respondents corresponds to the 0-24 minutes time range which indicating the majority of respondents spend between 0 to 24 minutes on average. Following this, there is a notable decrease in relative frequency for higher time ranges, with only 3% of respondents spending between 50 and 74 minutes on average and even fewer spending 75-99 minutes or 100-124 minutes.

3.2.6 Social Media Primarily Used during Online Lectures

Social media	Frequency
Instagram	29
Facebook	10
WhatsApp	8
Telegram	2
YouTube	3
Xiao Hong Shu	2
Twitter (X)	6
Tiktok	2
Total	62

Table 3.2.6.1 Frequency Distribution of Social Media Primarily Used by the Respondents During Online Lectures

Figure 3.2.6.1 Bar Chart of Social Media Primarily Used by the Respondents During Online Lectures

Figure 3.2.6.1 shows that 8 bars represent different specific platforms including Instagram, Facebook, WhatsApp, Telegram, YouTube, Xiao Hong Shu, Twitter(X) and Tiktok which are platforms reported by respondents. It goes without saying, that Instagram emerges as the most popular platform with 29 respondents indicating its usage, followed by Facebook with 10 respondents. WhatsApp and Twitter(X) are also notable with 8 and 6 respondents respectively. The remaining platforms have a smaller number of respondents.

3.2.7 Gradient Respondents Distracted by Social Media During Online Lectures

Gradient	Frequency
1 (lowest)	5
2	11
3	13
4	23
5 (highest)	10
Total	62

Table 3.2.7.1 Frequency Distribution of Respondents Distracted by Social Media During Online Lectures

Distracted by Social Media during Online Lecture

Figure 3.2.7.1 Dotplot of Respondents Distracted by Social Media During Online Lectures

As indicated in the table and figure 3.2.7.1, they show that the distribution of respondents ranked from 1 which is the lowest distraction to 5 which is the greatest distraction according to how distracted they were by social media during online lectures represented by a dotplot. The vertical location of each dotplot on the figure represents a single responder and reflects the degree of distraction they reported. With 13 respondents at level 3 and 23 respondents at level 4 fit into the mid-range categories. 5 respondents indicate the lowest level of distraction, level 1 and 10 respondents represent the maximum level, level 5. The distribution of distraction levels is clearly displayed by the dotplot which shows a noticeable concentration in the middle of the gradient scale.

3.2.8 Average Time (minutes) in Checking Social Media Notifications

Average time (mins)	Frequency
0-4	26
5-9	13
10-14	6
15-19	6
20-24	5
25-29	0
30-34	3
35-39	0
40-44	3
Total	62

Table 3.2.8.1 Frequency Distribution of Respondents Checking Social Media Notifications in Average Time (minutes)

Average of time (minutes) in Checking Social Media Notifications

Figure 3.2.8.2 Histogram of Respondents Checking Social Media Notifications in Average Time (minutes)

Based on figure 3.2.8.2 shows the distribution of respondents' average time spent on checking social media notifications. The most common interval is 0-4 minutes, with 26 respondents, followed by 5-9 minutes with 13 respondents. Even those who report a lower level of distraction, they still engage with social media for a short duration. As we move along the x-axis towards longer durations, the bars become shorter, indicating fewer

respondents checking social media for a longer periods. Smaller frequencies are observed in other intervals, with no respondents falling into the 25-29 minutes or 35-39 minutes ranges. Individuals who spend more time on social media may be more susceptible to distractions, which may make it harder for them to concentrate and participate in online lectures.

3.2.9 Missed Important Information during Online Lectures

Missed information	Frequency
Yes	45
No	17

Table 3.2.9.1 Frequency Distribution of Gradient of Missed Important Information During Online Lectures

Miss Important Information during Online Lecture

Figure 3.2.9.1 Pie Chart of Gradient of Missed Important Information During Online Lectures

The pie chart represents respondents' experiences regarding missed important information during online lectures. Of the respondents, the majority which is 72.6% said they had missed information ("Yes") while only 27.4% said they had not missed any crucial information ("No"). This indicates that a large portion of the student population is having trouble paying attention and engaged during online classes.

This finding aligns with the expectation of lower levels of active engagement attendance due to heightened social media usage during lectures. When students are immersed in social media during online lectures, they may give priority to scrolling through feeds, checking notifications or engaging in online conversations over paying attention to the lecturer. As a result, they may miss crucial explanations and instructions from lecturer, which could leave gaps in their understanding of the materials.

3.2.10 Average Time (hours) of Uninterrupted Study on A Typical Day

Time(hours) uninterrupted	Frequency	Relative Frequency	Cumulative frequency
0 - <= 1.0	17	0.27	0.27
1.0 - <= 2.0	19	0.31	0.58
2.0 - <= 3.0	14	0.23	0.81
3.0 - <= 4.0	4	0.06	0.87
4.0 - <= 5.0	5	0.08	0.95
5.0 - <= 6.0	3	0.05	1.00
Total	62	1.00	1.00

Table 3.2.10.1 Frequency Table of Respondents' Average Time (hours) of Uninterrupted Study on a Typical Day

Figure 3.2.10.1 Bar Chart of Respondents' Average Time (hours) of Uninterrupted Study on a Typical Day

In figure 3.2.10.1, the bar chart shows how respondents' uninterrupted study time varies on a typical day and is segmented into 6 time intervals. Each bar corresponds to a specific time range which is 0 to 6 hours. The highest frequency of respondents falls within the 1 to 2 hours range with 19 respondents. It was followed closely by the 0 to 1 hour range with 17 respondents. As study time increases, fewer respondents fall into each category with the least common being 5 to 6 hours and 3 to 4 hours.

From these data, it's evident that a significant portion of students spend relatively short periods of uninterrupted study time on a typical day. It makes sense to propose that shorter study sessions may result in shorter attention spans when taking into consideration how this data relates to the problem of missing important details during online lectures. Student who are used to shorter study sessions may find it difficult to stay focused during long online lectures and miss the information. Additionally, even among students who allocate longer periods of uninterrupted study time, it's still possible for students to miss crucial information. This could be due to the factors such as exhaustion, which affect focus no matter how much time is spent in studying straight through.

3.2.11 Gradient of Respondents' Overall Academic Performance Rating

Gradient	Frequency
1	2
2	2
3	16
4	25
5	17
Total	62

Table 3.2.11.1 Frequency Table of Gradient of Respondents' Overall Academic Performance Rating

Figure 3.2.11.1 Dotplot of Gradient of Respondents' Overall Academic Performance Rating

Respondents' overall academic performance ratings which are ranked from 1 to 5 are visually represented by the dotplot. A notable observation is that the highest frequency of respondents, 25 individuals, falls within the gradient level of 4, while 17 respondents have level 5 rating on their academic performance, indicating a relatively higher academic performance rating. The gradient level 3 is reported by 16 respondents where they think their

academic performance are fair only. In contrast, fewer respondents reported lower academic performance ratings. Only 2 respondents each reported ratings of gradient level 1 and 2, resilience indicating very low academic performance ratings.

This observation has initially seemed contrary to the expectation that distractions from social media during online classes would result in a lower academic performance rating. However, when considering the students may compensate for missing information by revising the material afterward, it will be logic to relate with the data collected. Student engaging themselves in proactive revision efforts or asking classmates for assistance to enhance their understanding of the material. Their subsequent revision efforts enable them to fill in any gaps in their understanding and reinforce their comprehension of the materials. As a result, their overall academic performance ratings may reflect higher achievement levels than initially expected.

3.2.12 Gradient Impact of Using Social Media during Online Lectures on Academic Performance

Gradient	Frequency
1	5
2	11
3	28
4	7
5	11
Total	62

Table 3.2.12.1 Frequency Table of Gradient of Impact of Using Social Media during Online Lectures on Academic Performance

Figure 3.2.12.1 Dotplot of Impact of Using Social Media during Online Lectures on Academic Performance

On a scale of 1 to 5, the dotplot illustrates the impact for respondents on using social media during online lectures on academic performance. Every dot on the plot denotes a distinct respondent and the degree of distraction is indicated by its location along the vertical axis. The highest frequency of respondents, 28 individuals, falls within the gradient level of 3(Neutral), which indicates that many respondents feels that the use of social media during online lectures neither enhances nor impairs their academic performance. Follow by the levels of 2 and 5 which represent Negative and Very Positive, each with 11 responses. The gradient level 4 (Positive) has a frequency of 7 respondent and lastly the lowest rating is level 1 which represent Very Negative with 5 respondents only.

Although there is variation in responses, with some indicating lower or higher impacts, these variations are spread evenly across gradient levels. This implies that individual perceptions of the impact of social media on academic performance may not always align with actual academic performance ratings.

4.0 Conclusion

In summary, numerous significant insights into the student population's behaviors and perceptions were obtained from the survey that was administered to them which included 62 respondents from different faculty in University Technology Malaysia. The findings indicated that social media distraction was significantly more common during online lectures, indicating that it may be difficult to stay focused in these types of virtual learning environments, which prove that the prediction regarding poor engagement and attendance was confirmed. Nonetheless, a considerable proportion of respondents reported that they had occasionally overlooked crucial details during virtual lectures, underscoring possible deficiencies in the efficacy of learning. In spite of this, most respondents usually only spent a few hours studying each day, showing that they took a proactive approach to their academic work. Positively, most respondents gave their overall academic performance a favourable rating which the expectation of poor academic performance was contradicted by the data, indicating that they generally felt proud of their accomplishments. Overall, the results highlight how complicated our respondents' experiences and actions are in online learning environments and how crucial it is to manage distractions while creating conditions that support successful learning and academic achievement.

Mathematically and technologically, conducting this study provided valuable insights into data analysis techniques and tools. From a mathematical perspective, it involved analyzing and interpreting the survey data through the use of statistical techniques like frequency distribution, relative frequency calculation and graphical representation such as bar charts, histograms, pie charts and dotplots. These methods made the possible to gain a deeper comprehension of the attitudes and behaviours of the community which facilitating informed decision-making. Moreover, the case study improved survey conductors' mathematical calculations such as calculating averages, cumulative frequencies and percentages. From a technological perspective, the study involved the use of digital survey platforms for data collecting and have used statistical tool such as R programming. This experience helped us to become more adept at using R programming tools for research and analysis purposes in the future so that we could successfully communicate our findings. In a nutshell, carrying out this study enhanced both mathematical and technological proficiency, providing useful abilities that may be applied in a variety of contexts.

Conducting this study provided valuable insights into the behaviors and perceptions of the surveyed population which is university students, highlighting both advantages and disadvantages of educational environments. As we keep adapting to changes in education, it's important to use what we've learned to make learning better and help students do well. Additionally, this study also emphasizes the value of mathematical and technological skills in research projects, demonstrating their usefulness in data interpretation analysis. In order to address the complexity of education and create environments that support successful learning and academic achievement, further research and inquiry will be essential.

5.0 Appendix

Screenshot of survey Google Form

The image displays two screenshots of a Google Form titled "SECI1143-02 PROBABILITY & STATISTICAL DATA ANALYSIS (PSDA)". The form is being viewed on a mobile device, as indicated by the status bar at the top showing the time as 2:10, 4G connectivity, and 95% battery. The form is shared via WhatsApp, with the contact name "WhatsApp" visible in the top left corner of the app interface.

**SECI1143-02
PROBABILITY &
STATISTICAL DATA
ANALYSIS (PSDA)**

The use of social media during online lectures has become increasingly prevalent, raising concerns about its impact on students' engagement, focus, and academic performance. This project aims to **investigate the influence of social media usage on online lecture attendance, participation**, and comprehension, as well as to explore potential strategies for effectively integrating social media into educational settings to enhance learning outcomes.

Please ensure all questions are fully completed. We prioritize your privacy and security; all data provided will be kept confidential and secure.
